

Remote Backup and Restore

Features

Multi-platform OS support

User-initiated restores by web portal

Usage-based billing

Single point-of-contact for support

Benefits

Control your IT backup costs

Manage your restore process

Increase efficiency with disk back-up instead of tape or do-it-yourself solutions

Reduce hassle with simple deployment

Now more than ever, the secure storage of your sensitive data is critical. You know you need to protect that data, but infrastructure upgrades and ongoing management can be cost-prohibitive. That's where we come in. We offer Verizon Remote Backup and Restore, a convenient and cost-effective back-up and recovery service for your business. By providing a secure off-site repository, we offer automatic back-ups and fast, on-demand restores. We put our capabilities to work for you, letting you focus more on your core business goals.

Secured Data

In today's networking world, you are faced with many disparate and often fragmented options to manage your data. When simple and cost-effective data storage is your business goal, turn to Verizon Remote Backup and Restore. A fully managed remote back-up and recovery service for your business, Remote Backup and Restore makes it fast and easy to protect data companywide—from corporate data centers to branch offices—with remote data protection of servers to a secure, highly available off-site facility.

Remote Backup and Restore Made Easy

Remote Back-up and Restore simplifies every aspect of caring for your remote data—from easy setup to automated backups and rapid web-based restores. Intelligent algorithms and improved bit-level efficiency (Commonality Factoring) help reduce daily back-up time by capturing incremental data changes made after the previous back-up and reducing the impact on system and network performance. With its web-based portal, Remote Backup and Restore helps provide rapid access to vital company data.

Note: Optional on-site solutions are available for local back-ups and fast restores.

New Levels of Efficiency and Cost-Effectiveness

Using bandwidth and storage-efficient technology, Remote Backup and Restore overcomes the historical limitations of network-based data protection by providing accessibility over your existing or dedicated Verizon network transport. Back-ups that took hours using older technology can now be completed in minutes, typically requiring you to copy only a tiny fraction of the data on a server to provide protection.

The service provides the consistency and security of a full back-up every day and provides you with the ability to restore data for any day recorded in the retention schedule. This dramatically improves the quality and thoroughness of your data back-ups while significantly reducing costs.

On-Demand Service

Compatible with most business operating systems, Remote Backup and Restore eases the burden of managing your remote data. It includes the hardware, software, installation, provisioning, and operational support for the solution, along with usage-based billing to reduce start-up time and costs. This offers you a fast, cost-efficient and convenient way to increase data protection across your offices and remote locations.

Fast, Reliable Recoverability

Remote Backup and Restore can be configured to remotely locate data for every server in your enterprise. By combining reliable, encrypted, on-demand back-up service, Remote Backup and Restore is a quick and effective way to protect data remotely.

Verizon: A Name You Know

You already know about our capabilities in network services and our commitment to service. The support structure for this service complements the services that you already enjoy from us. Our national network and the Internet are the transport options for this service. And in our single-point-of-contact model, problem ownership and resolution are our responsibility.

For more information on Remote Backup and Restore, please contact your Verizon Business account manager or visit us at www.verizonbusiness.com.

Services not available in all areas. InterLATA portions of network transport services provided by Verizon Select Services Inc. IntraLATA network transport services, including local network transport services, provided by Verizon local exchange companies. Remote Backup and Restore is provided through Verizon Information Technologies LLC, an IT Services subsidiary of Verizon Communications Inc.
